

# ARIZONA – WEEKLY INFLUENZA SUMMARY MMWR Week 1 (12/30/07 – 1/5/08) – Posted 1/5/08

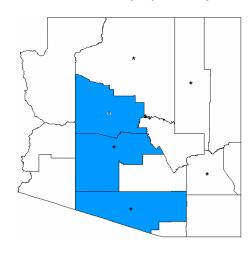

## Weekly Influenza Summary:

"Regional" influenza activity was reported in Arizona for the week ending on 1/5/2008 (week 1). A total of 123 cases have been reported from across six counties. No pediatric influenza-associated deaths have been reported in Arizona for the current season. The influenza-like-illness rate is above the state baseline for week 52.

Data in this report are provisional and may change as more reports are received.

National influenza surveillance data are available at the CDC's Influenza Surveillance site (http://www.cdc.gov/flu/weekly/fluactivity.htm).

# **Influenza Activity by County:**

#### Key:

\* = Any activity reported this season

Blue = Activity reported in past three weeks

White = No activity reported in past three weeks

# Flu Cases Reported 2007 – 2008 Season

114 045 05 114 P 01 104 200 : 2000 S 045 011								
County	# cases	County	# cases	County	# cases			
Apache	0	Greenlee	0	Pima	4			
Cochise	0	La Paz	0	Pinal	0			
Coconino	5	Maricopa	109	Santa	0			
				Cruz				
Gila	0	Mohave	0	Yavapai	1			
Graham	2	Navajo	2	Yuma	0			
				Total	123			

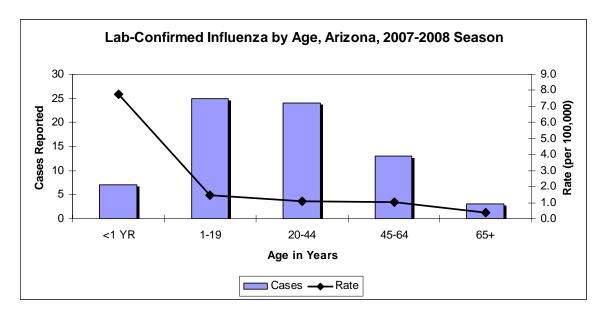

#### Flu Cases Reported Last Week

The Cases Reported East Week								
County	# cases	County	# cases	County	# cases			
Apache	0	Greenlee	0	Pima	0			
Cochise	0	La Paz	0	Pinal	0			
Coconino	0	Maricopa	42	Santa	0			
				Cruz				
Gila	0	Mohave	0	Yavapai	0			
Graham	0	Navajo	0	Yuma	0			
				Total	42			

#### Lab Surveillance:

Laboratories report positive influenza tests to ADHS. Of the lab-confirmed influenza reported this season, 81 are influenza A (32 confirmed by culture or PCR), 31 are influenza B (three confirmed by culture or PCR) and 11 are unknown.

#### **Subtyping – Culture or PCR Results:**

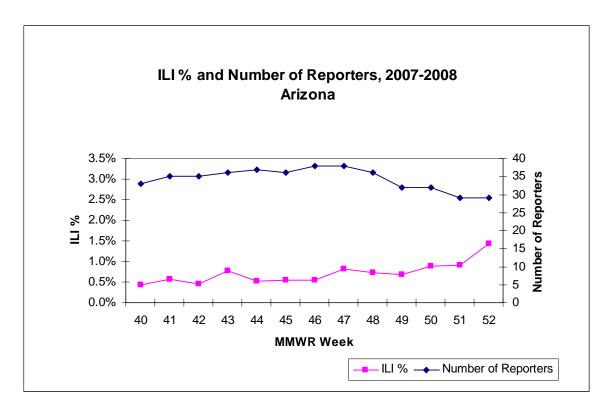

Viral isolation, or culture, is currently the "gold standard" for diagnosis of influenza virus infections. The influenza subtype can be determined by a test called hemagglutination inhibition (HI) using viral isolates. Polymerase chain reaction (PCR) can also be used to identify influenza B and the hemagglutinin (H) component of influenza A.

Of the 32 culture- or PCR-confirmed influenza A cases, 10 are H1 by PCR and four are H1N1 and the other 18 influenza A cases are unsubtyped. The three culture or PCR positive influenza B cases are unsubtyped.

### Influenza-Like Illness (ILI) Surveillance from Sentinel Providers

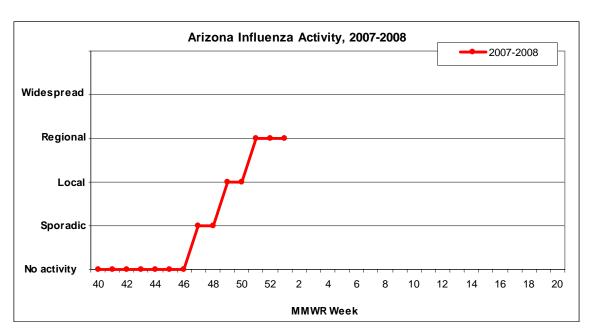

The proportion of patient visits to sentinel providers for ILI in the state was 1.4% for the week ending 12/29/2007 (week 52). This value is higher than the Arizona ILI baseline (0.5%).

ILI is defined as a fever of at least 100°F plus either a cough or a sore throat.

# Arizona Influenza Activity Levels

The graph below shows the influenza activity levels reported to the CDC for this season only. CDC has changed the reporting criteria for state activity levels so Arizona's data from previous seasons are no longer directly comparable to the current season. For week 1, Arizona reported "regional activity". Definitions of these reporting categories can be found at <a href="http://www.cdc.gov/flu/weekly/fluactivity.htm">http://www.cdc.gov/flu/weekly/fluactivity.htm</a>.

## **RSV** Activity in Arizona:

Increasing respiratory syncytial virus (RSV) activity has been reported in Arizona. As of 1/5/2008, 220 lab-confirmed cases have been reported. Eighty-four new cases of RSV were reported during week 1.
